

Abstract of the disclosure
The Natural Bibliographic Linking System

The Natural Bibliographic Linking System or "Nat Link" invention--for which I am herewith requesting a patent-- is characterized for being **a natural and exhaustive system of bibliographic linking** and also the most simple, objective, integrated, accurate and expeditious system of dealing with the universe of knowledge and information. It is also characterized for empowering end-users and scholars to service themselves, as never before.

The Natural Bibliographic Linking System or "NAT-LINK" invention can then be defined as the automated system of bibliographic management, whose bibliographic linking way is meant to be natural or close to reality as much as possible; and it is at the same time the most simple, direct and fluid system of handling the universe of knowledge and information; and in general of dealing with both digital and non digital resources.

William E. Guerra--February 1, 2002.
